

Make tab navigator in new app with 3 tabs.

1. First tab will have counter app functionality
2. Second tab will have todo functionality
3. Third tab will have following feature:
  - a. Ask user to write 3 options in 3 different input forms with 1 button name decide now.
  - b. Once user click on the button all forms will get empty and show one of the form field value below that button using `math.random` method. (Its like random result making from provided result)

Note: No need to use context API. All functionality can be implemented using states inside component.
